## EJX110A Differential Pressure Transmitter

**GS 01C25B01-01EN**

[Style: S3]

The high performance differential pressure transmitter EJX110A features single crystal silicon resonant sensor and is suitable to measure liquid, gas, or steam flow as well as liquid level, density and pressure. EJX110A outputs a 4 to 20 mA DC signal corresponding to the measured differential pressure. Its highly accurate and stable sensor can also measure the static pressure which can be shown on the integral indicator or remotely monitored via BRAIN or HART communications. Other key features include quick response, remote set-up using communications, diagnostics and optional status output for pressure high/low alarm. The multi-sensing technology provides the advanced diagnostic function to detect such abnormalities as an impulse line blockage or heat trace breakage. FOUNDATION Fieldbus and PROFIBUS PA protocol types are also available. All EJX series models in their standard configuration, with the exception of the Fieldbus and PROFIBUS types, are certified by TÜV as complying with SIL 2 for safety requirement.

### ■ STANDARD SPECIFICATIONS

#### ● Total Probable Error (M capsule)

±0.12% of Span @1:1 to 5:1 Rangedown  
Total probable error, known as a measure of the total performance of the transmitters under the condition of fixed line pressure.

$$\text{Total Probable Error} = \pm \sqrt{E_1^2 + E_2^2 + E_3^2}$$

E1: Reference Accuracy of Calibrated Span  
E2: Ambient Temperature Effects per 28°C change  
E3: Static Span Effects per 6.9 MPa change

#### ● Total Accuracy (M capsule)

±0.12% of Span @1:1 Rangedown  
±0.25% of Span @ 5:1 Rangedown  
Total accuracy is a comprehensive measure of transmitter total performance, covering all major factors in actual installation, that cause errors in measurement.

As a standard measure, YOKOGAWA uses this to evaluate transmitter performance.

$$\text{Total Accuracy} = \pm \sqrt{E_1^2 + E_2^2 + (E_3 + E_4)^2 + E_5^2}$$

E1: Reference Accuracy of Calibrated Span  
E2: Ambient Temperature Effects per 28°C change  
E3: Static Span Effects per 6.9 MPa change  
E4: Static Zero Effects per 6.9 MPa change  
E5: Overpressure Effects upto overpressure 25MPa

Not only a day-to-day changes in temperature can affect the measurement and lead to unnoticed errors; fluctuation of line pressure, incorrect operation of three/five valve manifold leading to over-pressure events, and other phenomena can have the similar result. Total Accuracy factors in such changes and errors and provides much comprehensive and practical determination of how a transmitter will perform under actual plant operation.

**Accuracy****Absolute Pressure**1 MPa or higher:  $\pm 0.2\%$  of spanLess than 1 MPa:  $\pm 0.2\% \times (1 \text{ MPa}/\text{span})$  of span**Gauge Pressure Reference**

Gauge pressure reference is 1013 hPa (1 atm)

Note: Gauge pressure variable is based on the above fixed reference and thus subject to be affected by the change of atmospheric pressure.

**□ FUNCTIONAL SPECIFICATIONS****Output “◊”**

Two wire 4 to 20 mA DC output with digital communications, linear or square root programmable. BRAIN or HART FSK protocol are superimposed on the 4 to 20 mA signal.

Output range: 3.6 mA to 21.6 mA

Output limits conforming to NAMUR NE43 can be pre-set by option code C2 or C3.

**Failure Alarm (Output signal code D, E and J)**

Analog output status at CPU failure and hardware error;

Up-scale: 110%, 21.6 mA DC or more (standard)

Down-scale: -5%, 3.2 mA DC or less

Analog output status at process abnormality (Option code /DG6);

The result of process abnormality detected by the advanced diagnostic function can be reflected to an analog alert status. The following three setting modes are available.

		Mode		
		Burnout	Fall back	Off
Standard	110%, 21.6mA or more			
Option Code	/C1	-2.5%, 3.6mA or less	Holds to a specified value within the output range from 3.6mA to 21.6mA	Normal output (No analog output alarm)

**Damping Time Constant (1st order)**

Amplifier damping time constant is adjustable from 0.00 to 100.00 s by software and added to response time.

Note: For BRAIN protocol type, when amplifier software damping is set to less than 0.5 s, communication may occasionally be unavailable during the operation, especially while output changes dynamically. The default setting of damping ensures stable communication.

**Update Period “◊”**

Differential pressure: 45 ms

Static pressure: 360 ms

**Zero Adjustment Limits**

Zero can be fully elevated or suppressed, within the lower and upper range limits of the capsule.

**External Zero Adjustment**

External zero is continuously adjustable with 0.01% incremental resolution of span. Re-range can be done locally using the digital indicator with rangesetting switch.

**Integral Indicator (LCD display, optional) “◊”**

5-digit numerical display, 6-digit unit display and bar graph.

The indicator is configurable to display one or up to four of the following variables periodically.:

Measured differential pressure, differential pressure in %, scaled differential pressure, measured static pressure. See also “Factory Setting.”

**Local Parameter Setting (Output signal code D, E, and J)**

Parameter configuration by the external zero adjustment screw and push button (Integral indicator code E) offers easy and quick setup for parameters of Tag number, Unit, LRV, URV, Damping, Output mode (linear/square root), Display out 1, and Re-range by applying actual pressure (LRV/URV).

**Burst Pressure Limits**

69 MPa (10,000 psi) for wetted parts material S, except for Measurement span F.

**Advanced Diagnostics (optional) “◊”**

Applicable for Output signal code E, J and F.

## • Impulse line blockage detection

The impulse line condition can be calculated and detected by extracting the fluctuation component from the differential pressure and static pressure signals. The EJX110A detects the impulse line abnormality particularly which side of impulse line is plugged.

## • Heat trace monitoring

The change of the flange temperature calculated by using the two temperature sensors built in the EJX enables to detect the heat trace breakage or the abnormal temperature due to the failure.

**Signal Characterizer (Output signal code D, E and J)**

User-configurable 10-segment signal characterizer for 4 to 20 mA output.

**Status Output (optional, output signal code D, E and J)**

\*1: ▲ Users must consider the characteristics of selected wetted parts material and the influence of process fluids. The use of inappropriate materials can result in the leakage of corrosive process fluids and cause injury to personnel and/or damage to plant facilities. It is also possible that the diaphragm itself can be damaged and that material from the broken diaphragm and the fill fluid can contaminate the user's process fluids.

Be very careful with highly corrosive process fluids such as hydrochloric acid, sulfuric acid, hydrogen sulfide, sodium hypochlorite, and high-temperature steam (150°C [302°F] or above). Contact Yokogawa for detailed information of the wetted parts material.

## &lt; Ordering Information &gt; “Φ”

Specify the following when ordering.

For output signal code –J, refer to GS 01C25T01-01EN.

1. Model, suffix codes, and option codes
2. Calibration range and units
  - 1) Calibration range can be specified with range value specifications up to 5 digits (excluding any decimal point) for low or high range limits within the range of -32000 to 32000. When reverse range is designated, specify Lower Range Value(LRV) as greater than Upper Range Value(URV). When square root output mode is specified, LRV must be “0 (zero)”.
  - 2) Specify only one unit from the table, ‘Factory setting.’
3. Select linear or square root for output mode and display mode.  
Note: If not specified, the instrument is shipped set for linear mode.
4. Display scale and units (for transmitters equipped with the integral indicator only)  
Specify either 0 to 100 % or ‘Range and Unit’ for engineering units scale:  
Scale range can be specified with range limit specifications up to 5 digits (excluding any decimal point) for low or high range limits within the range of -32000 to 32000. Unit display consists of 6-digit, therefore, if the specified scaling unit excluding ‘l’ is longer than 6-characters, the first 6 characters will be displayed on the unit display.
5. Tag Number (if required)  
Specified characters (up to 16 characters for BRAIN, 22 characters for HART) are engraved on the stainless steel tag plate fixed on the housing.
6. SOFTWARE TAG (for HART only. If required)  
Specified characters (up to 32 characters) are set as “Tag” (the first 8 characters) and “Long tag”\*1 (32 characters) in the amplifier memory. Use alphanumeric capital letters.  
When the “SOFTWARE TAG” is not specified, specified “TAG NO” is set as “Tag” (the first 8 characters) and “Long tag”\*1 (22 characters) in the amplifier memory.
- \*1: applicable only when HART 7 is selected.
7. Other factory configurations (if required)  
Specifying option code **CA** or **CB** will allow further configuration at factory. Following are configurable items and setting range.
  - [/CA : For HART communication type]
    - 1) Descriptor (up to 16 characters)
    - 2) Message (up to 30 characters)
    - 3) Software damping in second (0.00 to 100.00)
  - [/CB : For BRAIN communication type]
    - 1) Software damping in second (0.00 to 100.00)
